Heart Disease Classification

Using Machine Learning to help identify patients with heart disease

Overview

- Business + Business Problem
- The Project Data
- Model Iteration
- The Final Model
- Recommendations

The Business + Business Problem

- 17.9 million lives per year
- Health Care Providers → early diagnosis + treatment
- Machine Learning Model to predict if heart disease present

Photo by Michel E on Unsplash

The Project Data

- Sourced from <u>Kaggle</u> → UCI
 Machine Learning Database
- 11 Independent Factors (patient data)
- Data Preparation missing values for Cholesterol

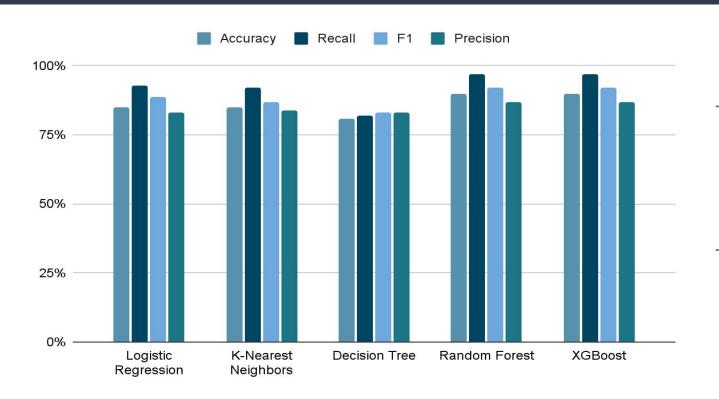

Photo by <u>DJ Johnson</u> on <u>Unsplash</u> - Cleveland Photo by <u>engin akyurt</u> on <u>Unsplash</u> - Hungary

Photo by Nils Leonhardt on Unsplash - Beach

Model Iteration

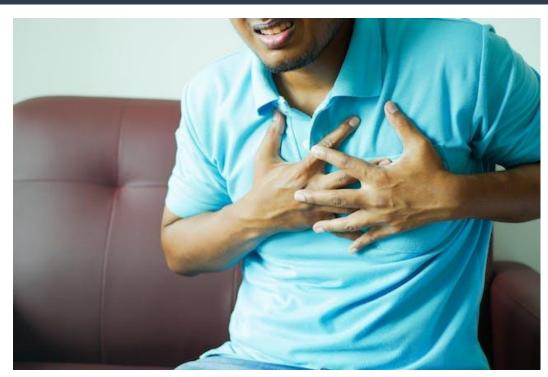

- Capture sick
 patients without
 undue burden on
 healthy patients
- Further tuning of best two models

The Final Model

Confusion Matrix		Predicted Value	
		Healthy	Heart Disease
True Value	Healthy	95	15
	Heart Disease	9	111

Recommendations

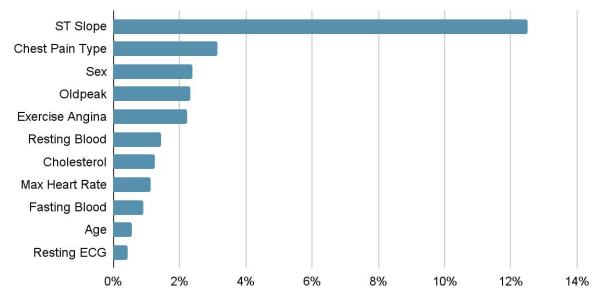

1. Use the Model!

Recommendations

Feature Importance

- Gather more ECG readings during exercise
- 3. Survey on Chest Pain

Mean Accuracy Decrease
